Version 2, 16-01-2026: Correction in conversion factor to 1 kg

Basis of calculation

This EPD is developed and verified in accordance with the European standard EN 15804+A2.

Comparability

EPDs of construction products may not be comparable if they do not comply with the requirements in EN 15804. EPD data may not be comparable if the datasets used are not developed in accordance with EN 15804 and if the background systems are not based on the same database.

Validity

This EPD has been verified in accordance with ISO 14025 and is valid for 5 years from the date of issue.

Use

The intended use of an EPD is to communicate scientifically based environmental information for construction products, for the purpose of assessing the environmental performance of buildings.

Product information

Product description

This EPD covers Knudsen Kilen K-Wall which is mainly made of ABS plastic. The ABS in the product is both pre- and post-consumer regrind material. The declared unit is 1 kg. In this declaration an overview of the weight per piece of the K-Wall 50i element is shown. The EPD covers all the production of the K-Walls in Slovakia, which are made for the Danish market. The main material components for the declared product are listed in the table below.

Material	Weight-% of declared product
ABS Regrind (pre-consumer)	89.1
ABS Regrind (post-consumer)	9.9
Masterbatch Irganox 1010	1.0

Product packaging:

The composition of the sales- and transport packaging of the product is shown in the table below.

Material	Weight of packaging material (kg)	Weight-% of packaging
Wooden pallet	0.155	66.8
Cardboard	0.076	32.7
Plastic (PE)	0.001	0.5
Total	0.232	100

Representativity

This declaration, including data collection and the modeled foreground system including results, represents the production of Knudsen Kilen K-Wall at a manufacturing site located in Slovakia. Product specific data are based on average values collected of the production of the product in the year 2024. Background data are based on datasets from Ecoinvent 3.10 and are in general less than 10 years old. Generally, the used background datasets are of high quality, and the

majority of the datasets are only a couple of years old. The data also has good presentiveness geographically with many of the processes being on a national specific basis or matching the region.

Hazardous substances

The Knudsen Kilen K-Wall does not contain substances listed on the "Candidate List of Substances of Very High Concern for authorisation"

(<http://echa.europa.eu/candidate-list-table>)

Product(s) use

The K-Wall is used in connection with the fitting of door- and window frames, where there is a need for firm and strong support for frame screws. K-Wall is made of ABS plastic and thus does not form thermal bridges such as e.g. metal fittings do. K-Wall is particularly suitable for allowing doors and windows to slide forward during external re-insulation processes. The products are permanently integrated in the building as a part of the building. Thus, the declared product is fulfilling the definition of a construction product and the LCA can be calculated according to EN15804+A2 and is in compliance with EPD Denmark's general program instructions (EPD Denmark, 2020).

Essential characteristics

Further technical information can be obtained by contacting the manufacturer or on the manufacturer's website:

knudsenkilen.dk

Reference Service Life (RSL)

Since the life cycle modules for the use phase are not included in this EPD, a reference service life (RSL) for the product is not relevant or applicable in this case and is therefore not specified.

Picture of product(s)

K-Wall 50i
ABS

Weight and conversion factor of Knudsen Kilen K-Wall 50i

Product and product no.	Weight per piece [g]	Conversion factor to 1 kg
K-Wall 50i - <i>product no. 986902120</i>	107.5	0.1075

The table above shows the weight in grams per individual piece for each product in the range of K-Wall that is covered in the EPD.

The values in the later results tables are all per 1 kg of product, and as such they are the same for all the products listed in the table above when considering a sum of 1 kg.

To calculate the environmental impacts attributed to a single K-Wall piece, the value for 'Conversion factor to 1 kg', that can be found for each piece individually, is multiplied to the values in the later results tables.

LCA background

Declared unit

The LCI and LCIA results in this EPD relates to the declared unit of 1 kg of the product Knudsen Kilen K-Wall. The K-Wall is used in the fittings of windows and doors with a minimal heat conductivity.

Name	Value	Unit
Declared unit	1	kg
Density	1050	kg/m ³

Functional unit

Not defined.

PCR

This EPD is developed according to the core rules for the product category of construction products in EN 15804:2012+A2:2019.

Conversion factors

The declared product comes in different product types, sizes and shapes as described. Thus, the declared unit (DU) is 1 kg of Knudsen Kilen K-Wall. In the declaration an overview table is provided to show the weight per piece of the Knudsen Kilen K-Wall. In addition, there are also provided conversion factors from pieces to 1 kg of K-Wall.

Energy modelling principles

Foreground system:

The product is produced using a mix of renewable energy sources with GO's at Knudsen Kilen's own internal manufacturing site in Slovakia: Biomass, Hydro, Gaseous fuel, and Wind power.

Information about the energy mix in the foreground system:

Energy mix	EF	Unit
GO's for internal mix	0.119	kg CO ₂ e/kWh

Background system:

Upstream processes are modelled using national energy mixes. Downstream processes are modelled using national energy mixes.

Flowdiagram

System boundary

This EPD is based on a cradle-to-gate LCA, in which 100 weight-% has been accounted for.

The general rules for the exclusion of inputs and outputs follows the requirements in EN 15804, 6.3.5, where the total of neglected input flows per module shall be a maximum of 5 % of energy usage and mass and 1 % of energy usage and mass for unit processes.

Product stage (A1-A3) includes:

A1 – Extraction and processing of raw materials

A2 – Transport to the production site

A3 – Manufacturing processes

The product stage includes raw materials as input material, transport of the raw material to the manufacturer's production site in Slovakia, electricity for plastic injection molding machines and utilities at the factory site, packaging materials for the finished declared product as well as waste processing of the material waste in production and the raw materials' packaging materials up to the "end-of-waste" state or final disposal, according to EN15804+A2 §6.3.5.2. In the production of 1 kg Knudsen Kilen K-Wall waste of 3% occurs in the production in module A3.

Once the product has been injection molded, the product is packaged with packaging materials consisting of EU pallets (wood), cardboard, and plastic wrap (PE). All these packaging materials are also included in the product stage in module A3. The EU pallets (wood) are assumed reused 25 times before disposal. Thus, the modelling has been done accordingly with 1/25 virgin material input and 24/25 secondary input material. For the packaging materials in A3 the biogenic carbon content from renewable materials (cardboard and wood), is calculated based on the standard EN16485 as 0.5 kg C/kg dry matter. The cardboard has a moisture content of 7.5% and the wood has a moisture content of 15%. The biogenic carbon content is calculated from 100% of the material weight input. There is no biogenic carbon content in the declared product leaving the system boundary.

In the production stage the transportation from the manufacturing site in Slovakia to the distribution facility in Frederiksværk, Denmark is also included. The production of the declared product Knudsen Kilen K-Wall is in Slovakia at Knudsen Kilen's own internal manufacturing site. At the internal manufacturing site, the electricity is with green electricity certificates (GoO = Guarantee of Origin).

The product consists of various plastic material input with both pre-consumer and post-consumer ABS granulate.

Construction process stage (A4-A5) includes:

Modules not declared.

Use stage (B1-B7) includes:

Modules not declared.

End of Life (C1-C4) includes:

Module C1 is assumed to be zero using manual dismantling.

In C2, the transport distance scenario is set to 50 km by truck based on a Danish national scenario.

In module C3-C4 the plastic is modelled with a waste treatment of 92% recycling, 4% incineration and 4% landfill which is the general assumption for the K-Wall. This waste scenario is based on national Danish waste statistics.

Re-use, recovery and recycling potential (D) includes:

To calculate the amount of net-scrap for credit in module D, the secondary input material in A1 has been deducted from the amount of material for recycling and incineration credit in module D.

The raw material inputs are pre- and post-consumer scrap material. For the pre-consumer plastic material, a monetary cost factor has been used to allocate the share of new material assumed in the regrind granulate. This cost factor applies in the material input in A1 but also in the material input in the D module which can achieve credit. The crediting only applies for the 92% of recycled material and the energy recovery of the 4% which get incinerated in C3.

BIOGENIC CARBON CONTENT PER 1 kg of Knudsen Kilen K-Wall		
Parameter	Unit	At the factory gate
Biogenic carbon content in product	[kg C]	0,00E+00
Biogenic carbon content in accompanying packaging	[kg C]	1.02E-01
Note	1 kg biogenic carbon is equivalent to 44/12 kg of CO ₂	

Additional information

LCA interpretation

The results in accordance with DS/EN 15804+A2 show that the life cycle modules A1-A3 have the largest contribution to all of the 13 core environmental impact categories. The dominant process which contributes the most in the core environmental impact categories is the pre-consumer ABS regrind input in the A1 module. The regrind raw material has the biggest contribution in 9 out of 13 core environmental impact categories for modules A1-A3. The injection moulding of the product in the A3 module has the biggest contribution in one impact category (GWP-luluc). The packaging material of the product has the biggest contribution to Climate Change, biogenic due to the embodied carbon stored in the biogenic packaging material (wood). The transportation of the product from Slovakia to Denmark has the biggest contribution to the core environmental impact categories ODP and ADPm. The EoL has a low impact due to the high share of recycling instead of incineration.
